

# FOOTBALL DETECTION AND TRACKING PROJECT

Under supervision: Eng.Ahmed Ayman

## Problem Statement

Manual tracking in football analytics presents significant challenges, demanding extensive time and resources. The process is prone to human error, especially when dealing with fast-paced action, varying camera angles, and occlusions. Accurately detecting and tracking small objects like the football across diverse video conditions (lighting, weather, resolution) is particularly difficult. Therefore, an **automated**, **accurate**, and **robust** object detection and tracking system is crucial to enhance football analytics and provide valuable insights.

## Solution

Our solution is an end-to-end computer vision system designed for real-time football detection and tracking. Key components include:

- **YOLO-based Models:** We leverage state-of-the-art YOLO models, including YOLOv8m, YOLOv11l, and a specialized model fine-tuned for precise ball detection.
- **Optimization Techniques:** We employ various optimization techniques to enhance model performance, speed, and accuracy. Techniques may include transfer learning, data augmentation, and model pruning.
- **Streamlit Web App:** The system is deployed as a Streamlit web application, providing a user-friendly interface for real-time video analysis and visualization of tracking results. This allows for interactive exploration of game footage and immediate access to analytics.

# Future Work

The following enhancements are planned for future development:

- **Multi-Camera Integration:** Integrate data from multiple cameras to provide a comprehensive view of the field and improve tracking accuracy.
- **3D Tracking:** Implement 3D tracking algorithms to capture depth information and enable more advanced spatial analysis.
- **Player Identification:** Incorporate player identification techniques to automatically recognize and track individual players.
- **Event Detection:** Develop algorithms to automatically detect key game events, such as passes, shots, tackles, and fouls.
- **Analytics Dashboards:** Create interactive dashboards to visualize key performance indicators (KPIs) and provide actionable insights for coaches and analysts.
- **Model Generalization:** Extend the system's capabilities to other sports, adapting the models and algorithms to new datasets and challenges.

End
